

Summary:

The invention relates to a process for the production of cellulosic fibres from solutions of
5 cellulose in an aqueous tertiary amine oxide whereby the extruded fibres are led through a
precipitating bath and cut and the cut fibres are passed through a series of water baths in the
form of a fleece and then dried, whereby the wash baths are connected to each other and fresh
washing liquor is applied to the last wash bath and led in countercurrent with the
10 transportation direction of the fibre fleece to the first wash bath. The process in accordance
with the invention is characterised in that the pH value of each of these wash baths is
maintained higher than 8.5.
